

# How many games do we have?

## Purpose

To test the ability to perform common mathematical functions

## Directions and example

Write a program to prompt the user for the number of people signed up to play bridge and output the number of games that can be run simultaneously. A bridge game involves four people. You can assume that the number of people signed up to play is at least zero.

```
How many people are signed up to play? 9  
That is enough for 2 games.
```

Note that the number of games must be an integer – you can't have 0.5 of a bridge game.
